

Deploy the Reports backend (Apps Script)

The Reports page reads your **private** weekly SM-performance Google Sheet. Because GitHub Pages is a static site, it cannot hold Google credentials — so a small Apps Script web app, bound to your sheet, does the reading and returns only the parsed **numeric** series as JSON. (Qualitative rows like Learnings / Remarks are never returned.)

⚠ Privacy note — please read. The web app must be deployed with Who has access: Anyone, and its `/exec` URL lives in the public AgenticPage repo. The **sheet itself stays private**, but anyone who has (or guesses/finds) the `/exec` URL could fetch the numeric report data. If that is not acceptable, keep the page in **Demo mode** (leave `REPORTS_SCRIPT_URL` empty) and it will show the bundled snapshot instead of live data.

This is a **different** spreadsheet than TargetSetter, so it needs its **own** Apps Script project bound to **this** sheet.

Steps

1. Open the weekly SM performance Google Sheet:
`https://docs.google.com/spreadsheets/d/1nB1sUNYWD8LlmcBtcdgeMA0c_F2Zgj-gjp0e4FQc-54/edit`
2. Menu: **Extensions ► Apps Script**. A new bound script project opens.
3. Delete any boilerplate in `Code.gs`, then paste the entire contents of `Code-reports.gs` (in this folder).
4. Click **Save** (.
5. Click **Deploy ► New deployment**.
6. Click the gear  next to “Select type” and choose **Web app**.
7. Set:
 - **Description:** `Reports backend`
 - **Execute as:** **Me** (your account)
 - **Who has access:** **Anyone**
8. Click **Deploy**. Authorize when prompted (review the permissions and Allow).
9. Copy the **Web app URL** (ends in `/exec`).
10. Paste it into `reports-config.js` at the repo root:

```
js
const REPORTS_SCRIPT_URL = "https://script.google.com/macros/s/XXXXX/exec";
```
11. Commit & push. The Reports page will switch from **Demo** to **Live**.

Updating later

If you change the sheet structure and need to redeploy: in Apps Script use **Deploy ► Manage deployments ► (edit) ► Version: New version ► Deploy**. The `/exec` URL stays the same, so no config change is needed.

Quick test

Open the `/exec` URL directly in your browser. You should see JSON like:

```
{ "generatedAt": "...", "brands": { "Isha Foundation": { "weeks": [...], "platforms": [...]} }, ... }
```
